ERTMS/ETCS

System Requirements Specification

Chapter 1

Introduction

REF : SUBSET-026-1
ISSUE : 3.6.0
DATE : 13/05/2016

1.1 Modification History

Issue Number Date	Section Number	Modification / Description	Author / Editor
0.0.1	All	first issue	SAB
0.1.0	All	Review comments from Adtranz	SAB
1.0.0	All	Final review	SAB
1.0.2 / 15. Apr. 1999	All	Reworked edition	SAB
1.0.3 / 22. Apr. 1999	1.8.9	Comment of Alstom	SAB
1.1.0 / 23. Apr. 1999		Final issue of class P SRS	Ch. Frerichs (ed.)
1.1.1 / 27. Mai 1999	1.3.1.1/1.7.1.2	Review comments added	SAB
1.1.2		Draft for class 1	SAB
1.1.3 990729	Document reference number.	Revision during finalisation meeting, Stuttgart 990729	HE
1.2.0 990730	Version number	Release version	HE
1.2.1 991209	All	First draft for 2nd release	SAB
1.3.0 991216	All	Review comments added	SAB
2.0.0 991222	Minor editing	Finalisation	SAB
2.0.1	All	Corrections after review	SAB
2.1.0	Version number	UNISIG release	SAB
2.2.0	Version number	UNISIG release	SAB
2.2.2 1.2.2002	Version number	Final edition	Ch. Frerichs
2.3.0 24/02/06	Version number, no change since 2.2.2	Release version	HK
3.0.0 23/12/08	1.8.7	Release version Re-use of chapter 6, now dedicated to management of older system versions	AH

3.0.1 22/12/09		Including the results of the editorial review of the SRS 3.0.0	AH
3.1.0 22/02/10	No change	Release version	AH
3.2.0 22/12/10	No change	Release version	AH
3.2.1 13/12/11		Including all CR's that are in state "Analysis completed" according to ERA CCM.	AH
3.3.0 07/03/12		Baseline 3 release version	AH
3.3.1 04/04/14	No change		OG
3.3.2 23/04/14	No change	Baseline 3 1st maintenance pre-release version	OG
3.3.3 06/05/14	No change	Baseline 3 1st maintenance 2nd pre-release version	OG
3.4.0 12/05/14	No change	Baseline 3 1st maintenance release version	OG
3.4.1 23/06/15	No change		OG
3.4.2 17/11/15	CR1266		OG
3.4.3 16/12/15	Update due to overall CR consolation phase		OG
3.5.0 18/12/15	Baseline 3 2nd release version as recommended to EC (see ERA-REC-123-2015/REC)		OG
3.5.1 28/04/16	No change		OG
3.6.0 13/05/16	Baseline 3 2nd release version		AH

1.2 Table of Contents

1.1 Modification History 2

1.3 Introduction 5
1.4 Advantages of an International Interoperable System 5
1.5 About this Document 5
1.6 How to Read and Use the SRS 6
1.7 Requirements 6
1.8 Contents of the SRS 6
1.8.2 Chapter 1: Introduction 7
1.8.3 Chapter 2: Basic System Description 7
1.8.4 Chapter 3: Principles 7
1.8.5 Chapter 4: Modes and Transitions 7
1.8.6 Chapter 5: Procedures 7
1.8.7 Chapter 6: Management of older System Versions 7
1.8.8 Chapter 7: ERTMS/ETCS Language 7
1.8.9 Chapter 8: Messages 8
1.8.10 Chapter 9: Classification of the SRS clauses 8

1.3 Introduction

1.3.1 Train control is an important part of any railway operations management system. In the past a number of different Automatic Train Control (ATC) systems have evolved in different countries at different times. These systems are incompatible and not interoperable with each other. Only a few of these systems are used in more than one country, and even in those cases there have been differences in detailed development which have resulted in incompatible and not interoperable versions.

1.3.2 Many railways anticipate a significant increase in density of train traffic and are rethinking their infrastructure strategy, to accommodate high levels of traffic, in which ATC systems play an important part. Also many railways would like to introduce standardised systems to reduce system costs. In order to establish international standardisation of ATC systems, the following document specifies the European Rail Traffic Management System/European Train Control System (ERTMS/ETCS).

1.4 Advantages of an International Interoperable System

1.4.1 The advantages expected by the railways can be summarised as:

- Cross border interoperability.
- Improvement of the safety of national and international train traffic.
- Improvement of international passengers and freight train traffic management.
- Shorter headway on heavily trafficked lines, by driving on moving block, enabling exploitation of maximum track capacity.
- The possibility of step-by-step introduction of the new technology.
- Enabling Pan-European competition between the manufacturers of ERTMS/ETCS components. Strengthening the position of the European railway industry on the world market.
- Enabling preconditions for future harmonisation in other areas of rail traffic management.

1.5 About this Document

1.5.1 The purpose of this document is to specify the unified European Train Control System (ETCS) from a technical point of view.

1.5.2 Some parts of the system are only specified to allow a migration from existing train control systems to ETCS (e.g. STM's) over a transition period. They might be removed in a future edition of the standard.

1.5.3 To reach technical interoperability it is necessary not only that telegrams are generated and understood according to well specified rules but also that a train respectively

text ckside equipment reacts in a uniform way to information received. Technical interoperability requires specifications of a detailed level.

list item 1 For operational interoperability it is necessary to add operating rules, engineering standards etc. to the system design. Reaching operational interoperability is outside the scope of the SRS.

section header 1.6 How to Read and Use the SRS

list item 1 The SRS covers 9 chapters, which are briefly described in the section following this introduction.

list item 2 All readers may need to refer to the Glossary of terms and abbreviations (SUBSET-023).

section header 1.7 Requirements

list item 1 This specification defines the functions that allow reaching the technical interoperability. This is materialised through numbered clauses which are formally identified as containing ERTMS/ETCS on-board and/or ERTMS/ETCS trackside requirements (see details in chapter 9).

list item 2 The ERTMS/ETCS on-board equipment shall implement all its allocated requirements, with the only exceptions and conditions explicitly stated in the Control-Command and Signalling TSI and in this SRS.

list item 3 For ERTMS/ETCS trackside the implementation of functions has to be defined according to the characteristics of the specific lines and the related operational needs. In any case, the requirements of this SRS, which are allocated to the trackside and related to the implemented functions, shall be respected.

list item 4 Intentionally deleted.

list item 5 Not specified requirements and solutions shall only be permitted as long as they do not generate any interoperability problems.

section header 1.8 Contents of the SRS

list item 1 The SRS defines the system requirements for the European Train Control System (ETCS) of ERTMS.

list item 2 This sub-section is intended to give a rough overview of the contents of each chapter within the SRS so that readers interested only in specialised subjects can easily find the relevant chapters.

1.3.1 Chapter 1: Introduction

1.3.1.1 Chapter 1 (this chapter) gives a general introduction to the intention and structure of the SRS, including a brief overview of the contents of each chapter.

1.3.2 Chapter 2: Basic System Description

1.3.2.1 Chapter 2 gives an overview of the ERTMS/ETCS system structure.

1.3.2.2 Chapter 2 also contains a description of the basic application levels.

1.3.2.3 Chapter 2 does not contain technical requirements.

1.3.4 Chapter 3: Principles

1.3.4.1 Chapter 3 specifies the system principles of ETCS/ERTMS. These principles apply to onboard and trackside subsystems.

1.3.4.2 The principles define the behaviour of the system in general and functional terms.

1.3.5 Chapter 4: Modes and Transitions

1.3.5.1 Chapter 4 defines the modes of the ERTMS/ETCS onboard equipment and all transitions between modes.

1.3.6 Chapter 5: Procedures

1.3.6.1 Chapter 5 defines the dynamic behaviour of procedures that are necessary for interoperability. Procedures are presented by a state transition chart and a corresponding table, where all elements (States, events, transitions) of the chart are defined. The description of the procedures shows all states of the ERTMS/ETCS onboard unit and the conditions that must be fulfilled to switch from one state to another.

1.3.7 Chapter 6: Management of older System Versions

1.3.7.1 Chapter 6 defines the envelope of legally operated system versions and lists the exceptions that shall apply by derogation to the requirements listed in the other chapters of the SRS, when an older ERTMS/ETCS system version is used by the trackside subsystem.

1.3.8 Chapter 7: ERTMS/ETCS Language

1.3.8.1 Chapter 7 defines and describes the necessary variables to be used for the data flow over the air gap between track and train. The grouping of these into packets is described. The format of messages is given in Chapter 8.

1.3.9 Chapter 8: Messages

1.3.9.1 Chapter 8 defines the application protocol (format and content of messages, logical sequence for radio) necessary to achieve technical interoperability.

1.3.9.2 The scope of this chapter is limited to the application protocol and the content of messages.

1.3.10 Chapter 9: Classification of the SRS clauses

1.3.10.1 Chapter 9 encloses a classification into categories of all the clauses in the chapters 1 to 8 of the SRS.

1.3.10.2 In particular to assess properly the compliance of an ERTMS/ETCS on-board equipment with the SRS, it identifies which clauses contain requirements allocated to the ERTMS/ETCS on-board equipment and conversely which ones do not, either because they contain requirements allocated to the ERTMS/ETCS trackside only or because they are of another type.
